Parents are tasked with the job of caring for and worrying about their babies, but their crib should not be another thing that adds risk to their baby’s well-being. Especially for parents with limited physical mobility, their crib should serve both them and their baby.

Our project, **A Better Crib**, is a safe, accessible, affordable, and sustainable crib, which will have a range of practical features, including automated rocking, drop-down mesh walls, a speaker for soothing music and white noise, a fan and sensor to regulate temperature, and a monitor for the baby’s movement and heart rate, most of which will be accessible through a mobile app.
