In our review of all of our symptomatic students and suspected cases, it is clear that fully vaccinated students are also at risk for contracting mumps. In fact, the confirmed case was fully vaccinated. It is known that the mumps vaccine is 88% effective. Although there is still value in the vaccine, all students, faculty, staff and visitors who have been on campus after April 28 should be monitoring for symptoms of mumps.

**What is mumps?**
Mumps is an infection of the salivary glands caused by a virus.

**What are the symptoms?**
The most common symptoms include:
- Fever
- Headache
- Muscle aches
- Tiredness
- Loss of appetite

Swollen and tender salivary glands under the ears on one or both sides (parotitis).
About one-third of people who get mumps do not get the swollen glands.

Symptoms typically appear 14-18 days after infection, but this period can range from 12-25 days after infection. Very rarely, the virus can also cause swelling of the heart and joints, meningitis (swelling of the brain and spinal cord), and encephalitis (swelling of the brain itself). **If you have any of these symptoms, please contact your health care provider.**

**How is mumps spread?**
Mumps spreads through saliva or mucus from the mouth, nose, or throat. An infected person can spread the virus by coughing, sneezing, or talking; sharing items, such as cups or eating utensils, with others; and touching objects or surfaces with unwashed hands that are then touched by others. People may be able to spread mumps from **2 days before symptom onset to 5 days after symptom onset.**

**How can mumps be prevented?**
Mumps can be prevented with MMR (measles-mumps-rubella) vaccine. Most children and young adults have received at least one dose of MMR vaccine. Two doses of MMR vaccine are more effective than one dose. The vaccine is 88% effective after two doses.

Prevention of mumps is centered on good hygiene. The mumps virus lives in the salivary glands and can be spread when droplets from a sick person’s mouth gets into the mouth of a susceptible person.

- Always cover your nose and mouth when you cough or sneeze
- Wash your hands frequently
- Dispose of used tissues and other similar objects appropriately
- Do not share glasses, eating utensils, water bottles, etc.
- Limit kissing
- Do not share smokes or lipstick

**Recommendations**
- **People ill with mumps should refrain from public activities for five days after onset of swelling.**
- All individuals with only 1 dose of MMR vaccine should receive a 2nd dose of vaccine if eligible.
- Individuals with no doses of MMR vaccine should receive their 1st dose (unless they have laboratory evidence of immunity).
- Birth before 1957 is usually considered adequate evidence of immunity for mumps, except for health care workers who should have 2 doses of MMR or laboratory evidence of immunity.
What if you are pregnant or have a weakened immune system?

If you are pregnant (or think that you might be) or if you have a weakened immune system and believe you have been exposed to mumps, it is very important that you contact your health care provider right away. Tell them that you have received this advisory.
